The following details need to be added to the RoadBED drawing: The delaminations in the slab are approximately 1/8" thick. They are constructed of 2 sheets of 1/16" thick Cell-Aire closed cell polyethylene foam (commonly used as packing material). Delamination A is 2" deep. Delamination B is 2.75" deep. The write up shows a 3rd delamination (Delamination C) that isn't on the actual drawings. It may have been left out of the actual slab at construction time or we may find it's there in the field. At any rate, if it's there, referencing the plan view, it's centered 4' from the left hand side and 1' from the top. The diameter is 6" and it is at a depth of 2".
